Insel-Beispiel (Generationsbereich: 2000^2 m)

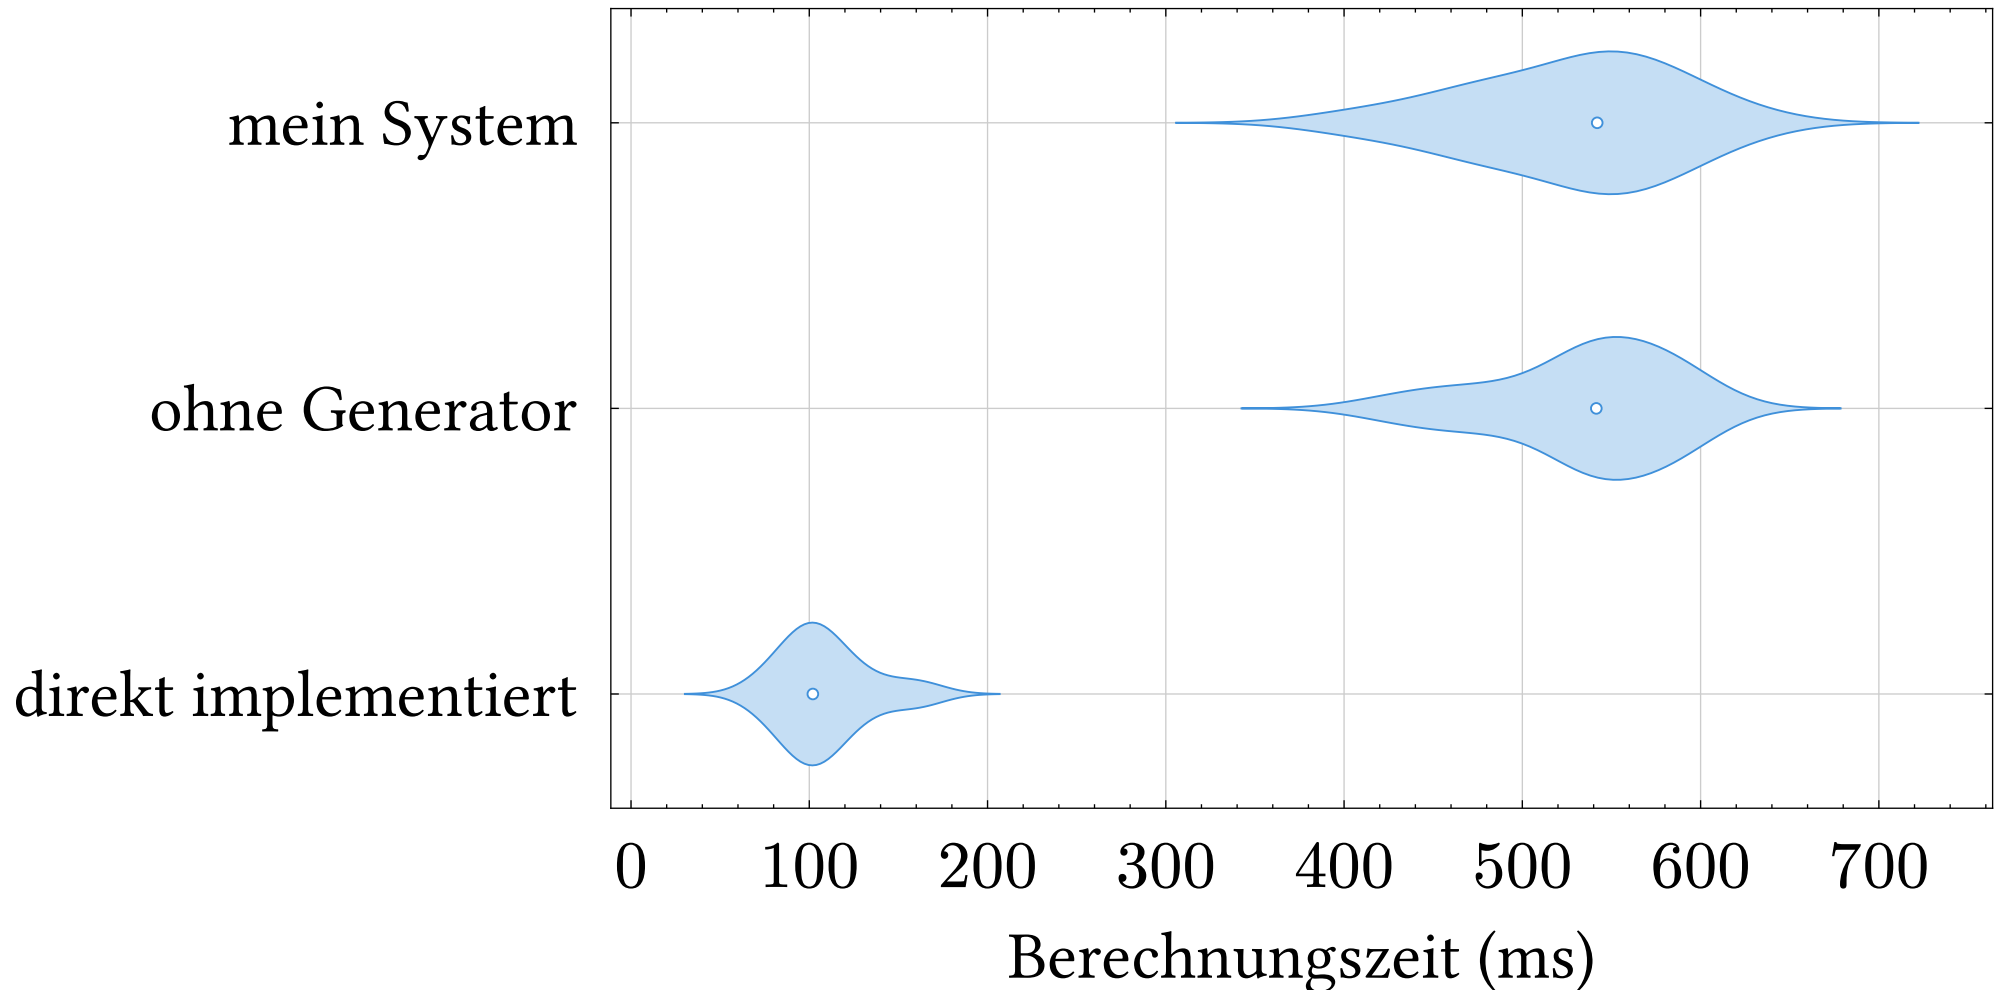

Insel-Beispiel (Generationsbereich: 20000^2 m)

Höhlen-Beispiel

Insel-Beispiel

- Skalierung von sehr große Welten
- Integration in bestehende Game Engines
- Parallelisierung der Generierung
- Automatische Cache-Optimierung
- Kreis-Abhängigkeiten & Leere Lösungen
- Experten-Meinungen zur Bewertung der Nützlichkeit

```
enum TemplateValue {  
    Number(NumberValue),  
    Position(PositionValue),  
    Volume(VolumeValue),  
    ...  
}
```

```
enum PositionValue {  
    Add((PosIndex, PosIndex)),  
    Sub((PosIndex, PosIndex)),  
    Numbers([NumberIndex; 3]),  
    ...  
}
```

```
let values: Vec<TemplateValue>
```

```
fn make_position(child_node: &EditorNode,  
                 in_index: usize) -> PosIndex {
```

```
    let node = child_node.inputs[in_index];
```

```
    let value = match &node.data_type {
```

```
        EditorNodeType::Add => {
```

```
            let a = make_position(node, 0, ...);
```

```
            let b = make_position(node, 1, ...);
```

```
            TemplateValue::Position(PositionValue::Add((a, b)))
```

```
        },
```

```
        EditorNodeType::Sub => ...
```

```
    }
```

```
fn calc_position(index: PosIndex) -> SmallVec<Vec3> {  
  
    match values[index] {  
        PositionValue::Add((a_index, b_index)) => {  
            let a = calc_position(a_index);  
            let b = calc_position(b_index);  
  
            return a.cartesian_product(b)  
                .map(|(a_v, b_v)| a_v + b_v);  
        },  
        PositionValue::Sub => ...  
    }  
}
```
